Matrices, Section II: Orthogonal Actions)
<u>____?</u>
```

### Section I. Quaternionic Matrices: Definition and Intrinsic Structure

- \*\*1. Algebraic Background\*\*
- Let \( \mathbb{H} \) denote the division ring of quaternions: \( \mathbb{H} = \ { a + bi + cj + dk \mid a,b,c,d \in \mathbb{R} \} \)
- Quaternion multiplication is noncommutative:  $\langle (ij = k, ji = -k) \rangle$ , etc.
- \*\*2. Quaternionic Matrix Space\*\*
- Define \(  $M_n(\mathbb{H}) \$ ): the set of all \( n \times n \) matrices with entries in \( \mathbb{H} \).
- These matrices act on \( \mathbb{H}^n \cong \mathbb{R}^ $\{4n\} \$ \), a right module over \( \mathbb{H} \).
- \*\*3. Spectrum and Eigenstructure\*\*
- Left and right eigenvalues must be distinguished:
- In general, spectral theory over \( \mathbb{H} \) requires the S-spectrum or slice-regular function theory.
- \*\*4. Norm and Invariants\*\*
- Define quaternionic matrix norm:  $( |A|^2 = \sum_{i,j} |a_{ij}|^2 )$
- Invariant under unitary transformations in \( Sp(n) \) or \( SL(2, \mathbb{H}) \)
- \*\*5. Intrinsic Invariant Function\*\*
- Given a unit quaternionic matrix \( Q \), define:
- $[ \theta(Q) := \log \det (I Q) \quad \text{text{or} \quad (Q) := } text{Tr}(\log(Q Q^\deg(P)) )]$
- Used in defining Kosmic functor action in the original document.

---

### Section II. Orthogonal Matrices as Derived Representations

```
**1. Rotation Matrices from Quaternions**
```

- Every unit quaternion (q = a + bi + cj + dk) can be mapped to an orthogonal matrix  $(Q \in SO(4))$ :

```
\[ Q = \begin{bmatrix}
a^2 + b^2 - c^2 - d^2 & 2(bc - ad) & 2(bd + ac) & 0 \\
2(bc + ad) & a^2 - b^2 + c^2 - d^2 & 2(cd - ab) & 0 \\
2(bd - ac) & 2(cd + ab) & a^2 - b^2 - c^2 + d^2 & 0 \\
0 & 0 & 0 & 1
\end{bmatrix} \]
```

- \*\*2. Orthogonality Preservation\*\*
- By construction:  $(Q^T Q = I)$ , so  $(Q \in SO(n))$
- Preserves Euclidean norm:  $\langle |Qx| = |x| \rangle$
- \*\*3. Role in Dynamical Process\*\*
- In the document, \( Q n \) derived from \( q n \in \mathbb{H} \) acts as:

- Thus, orthogonal matrices here are induced tools, not primitives.

---

### Section III. Structural Comparison and Independence

| Feature | Quaternionic Matrix \( M\_n(\mathbb{H}) \) | Orthogonal Matrix \( Q \in SO(n) \) |

```
|-----|
```

| Scalar field | Quaternion \( \mathbb{H} \), noncommutative | Real \( \mathbb{R} \), commutative |

| Eigenstructure | Left/right eigenvalue distinction | Standard spectrum \( \lambda \in \mathbb{R} \) |

| Norms | Quaternionic norm \( \|A\| \), possibly non-symmetric | Euclidean-preserving norm |

$ \ Algebraic\ group\  \ \ \ \ Sp(n),\ SL(2,\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $
Role in document   Primary structure with intrinsic invariants   Derived operator from \( q_n \)
**Conclusion:**
- Quaternionic matrices in the document are foundational and structurally distinct from orthogonal matrices.
- Orthogonal matrices are shown to emerge as representations of quaternionic action, not the other way around.
- Therefore, the document supports the idea that quaternionic matrix theory is not reducible to orthogonal matrix analysis, but rather contains it as a derived case.
